

Computer Science – IA Interview

After the client accepted my meeting, I proposed my help to solve his problem. I explained that I can help him by creating the application in order to increase the efficiency of the business. He gladly accepted my offer. During the interview the client told me the list of basic functions that he wants the app to have:

- List of customers. Each of them should be represented with a number, address, and name.
- List of orders. Each of them should also be represented with the id given manually by the client, the order info containing the information about the products that are ordered, and the delivery address for the product to be delivered.

After the first interview, I had time to evaluate and think about the features which could be added to the application and proposed it to him in the second interview:

- Order can have different buttons which after a click would do certain things. These things include: calling the client without finding the number on the contacts list, opening the location address of the order, and finishing the order.
- Clients can also have different buttons which after a click would do certain things. These things include: calling the client without copying the number, opening the client's address, and deleting the client.

He liked the proposed features and told me if possible, to add the map in which all the orders would be marked and the details of the orders, which he would provide later. I answered that that would be possible to add.
